

Ground Support Systems

A Ground Support System or GSS is a structural system comprised of Aluminium trusses which are joined into a grid to provide support for Lighting, Audio and Audio Visual Systems.

They may be used both indoors and out and when outdoors can also have an added roof and walls to provide protection from the elements.

Statewide Staging Systems GSS utilise custom manufactured 350, 450 & 750mm truss to deliver spans upto 18m and trims of 12m. All our systems are engineer designed and certified for the specified and quoted load requirements.

Statewide can custom design a system to meet your requirements. To do this both safely and cost effectively we require a comprehensive and accurate hanging plot no less than 4 weeks prior to show time and at least two weeks prior to any quotation.

We can also provide daughter grids, CM Lodestar chain motors, spot lines, trusses and bars as required.

By arrangement we can also meet all your specialised cloth / softs and scenic requirements.

Note:

Ground Support Systems are not suitable for use on sloping, uneven or soft ground and when set-up outdoors require ground anchors or heavy mass anchors for safety reasons
